## Section II. (Amendments to the Claims)

Please cancel claims 26-45, as set out below in the listing of claims 1-45 of the application.

- 1. (Original) A method for the electrochemical detection of an analyte molecule by means of a detection electrode, the method comprising:
- (a) immobilizing capture molecules, which are capable of binding the analyte molecule to be detected, on the detection electrode;
- (b) contacting the electrode with a solution supposed to contain the analyte molecule to be detected;
- (c) allowing the analyte molecule contained in said solution to bind to the capture molecules on the electrode, thereby allowing formation of complexes between a capture molecule and an analyte molecule, said complexes forming a first layer on the detection electrode;
- (d) contacting the detection electrode with an electrochemical activator, wherein said electrochemical activator has a electrostatic net charge that is complementary to the electrostatic net charge of the complex formed between a capture molecule and an analyte molecule, thereby forming a second layer on the electrode, wherein the second layer and the first layer together form a conducting bilayer;
- (e) contacting the detection electrode with an agent capable of transferring electrons to or from the electrochemical activator from or to the electrode, respectively; performing an electrical measurement at the detection electrode, and;
- (g) detecting the analytes by comparing the result of the electrical measurement obtained with that of a control measurement.
- 2. (Original) The method of claim 1, wherein the electrochemical activator is a polymeric redox mediator capable of transferring electrons between the analyte and the electrode.
- 3. (Original) The method of claim 2, wherein the electrochemical activator comprises metal ions.
- 4. (Original) The method of claim 3, wherein the metal ions are selected from the group consisting of silver, gold, copper, nickel, iron, cobalt, osmium, ruthenium, and mixtures thereof.
- 5. (Original) The method of claim 4, wherein the electrochemical activator is selected n-phosphonic acid, wherein n = 0-12.
- 6. (Original) The method of claim 1, wherein the agent capable of transferring electrons to or from the electrochemical activator is an enzyme or an enzyme-conjugate.

- 7. (Original) The method of claim 6, wherein the enzyme is an oxidoreductase or a mixture of oxidoreductases.
- 8. (Original) The method of claim 7, wherein the oxidoreductase is selected from the group consisting of glucose oxidase, hydrogen peroxidase, lactate oxidase, alcohol dehydrogenase, hydroxybutyrate dehydrogenase, lactic dehydrogenase, glycerol dehydrogenase, sorbitol dehydrogenase, glucose dehydrogenase, malate oxidase, galactose oxidase, xanthine dehydrogenase, alcohol oxidase, choline oxidase, xanthine oxidase, choline dehydrohenase, pyruvate dehydrogenase, pyruvate oxidase, oxalate oxidase, bilirubin oxidase, glutamate dehydrogenase, glutamate oxidase, amine oxidase, NADPH oxidase, urate oxidase, cytochrome C oxidase, and actechol oxidase.
- 9. (Original) The method of claim 1, wherein the capture molecules are capable of specifically binding the analytes to be detected.
- 10. (Original) The method of claim 1, wherein the analyte to be detected is selected from the group consisting of nucleic acids, oligonucleotides, proteins, peptides, oligosaccharides, polysaccharides and complexes thereof.
- 11. (Original) The method of claim 10, wherein the analyte to be detected is a nucleic acid molecule.
- 12. (Original) The method of claim 11, wherein the nucleic acid molecule has a pre-defined sequence.
- 13. (Original) The method of claim 12, wherein the nucleic acid molecule comprise at least one single-stranded region.
- 14. (Original) The method of claim 13, wherein the capture molecule is at least one nucleic acid probe having a sequence complementary to a single-stranded region of the nucleic acid molecule to be detected.
- 15. (Original) The method of claim 10, wherein the analyte to be detected is a protein or a peptide.
- 15. (Original) The method of claim 15, wherein the capture molecule is at least on ligand capable of binding proteins or peptides.
- 16. (Original) The method of claim 1, wherein a blocking agent is immobilized on the electrode prior to contacting the electrode with the solution supposed to contain the analyte molecule.
- 17. (Original) A method for the electrochemical detection of an analyte molecule by means of a detection electrode, the method comprising:

- (a) immobilizing capture molecules, which are capable of binding the analyte molecule to be detected, on the detection electrode;
- (b) contacting the electrode with a solution supposed to contain the analyte molecule to be detected;
- (c) allowing the analyte molecule contained in said solution to bind to the capture molecules on the electrode, thereby allowing formation of complexes between a capture molecule and an said complexes forming a first layer on the detection electrode;
- (d) contacting the detection electrode with an electrochemical activator, wherein said electrochemical activator has an electrostatic net charge that is complementary to the electrostatic net charge of the complex formed between a capture molecule and an analyte molecule, thereby forming a second layer on the electrode, wherein the second layer and the first layer together form a conducting bilayer, and wherein the capture molecules are capable of transferring electrons to or from the electrochemical activator from or to the electrode, respectively;
- (e) performing an electrical measurement at the detection electrode, and; detecting the analytes by comparing the result of the electrical measurement obtained with that of a control measurement.
- 18. (Original) An electrode arrangement, comprising a detection electrode, suitable for carrying out an electrochemical detection of an analyte molecule as defined in claim 1, comprising:
- (a) a first layer on the detection electrode comprising complexes between a capture molecule, which is capable of binding the analyte molecule to be detected, and an analyte molecule; and
- (b) a second layer comprising an electrochemical activator, wherein said electrochemical activator has an electrostatic net charge that is complementary to the electrostatic net charge of the complex formed between a capture molecule and an analyte molecule, wherein the second layer and the first layer together form a conducting bilayer.
- 19. (Original) The electrode arrangement of claim 18, wherein the electrochemical activator is a polymeric redox mediator capable of transferring electrons between the analyte and the electrode.
- 20. (Original) The electrode arrangement of claim 19, wherein the agent for increasing conductivity of the analytes contains metal ions.
- 21. (Original) The electrode arrangement of claim 20, wherein the metal ions are selected from the group consisting of silver, gold, copper, nickel, iron, cobalt, osmium, ruthenium and mixtures thereof.
- 22. (Original) The electrode arrangement of claim 18, further comprising an agent capable of transferring electrons to or from the polymeric redox mediator from or to the electrode, respectively, wherein the agent is bound to, intercalated in or associated with the conducting bilayer

- 23. (Original) The electrode arrangement of claim 22, wherein the agent is an enzyme or an enzyme-conjugate.
- 24. (Original) Use of an electrode arrangement of claim 18 as biosensor.
- 25. (Original) A biosensor for the electrochemical detection of an analyte molecule, comprising:
- (a) an detection electrode;
- (b) a first layer on the detection electrode comprising complexes between a capture molecule, which is capable of binding the analyte molecule to be detected, and an analyte molecule; and
- (c) a second layer comprising an electrochemical activator, wherein said electrochemical activator has an electrostatic net charge that is complementary to the electrostatic net charge of the complex formed between a capture molecule and an analyte molecule, wherein the second layer and the first layer together form a conducting bilayer.

26.-45. (Cancelled)
